

# OUTPUT FOR THE HANDS-ON

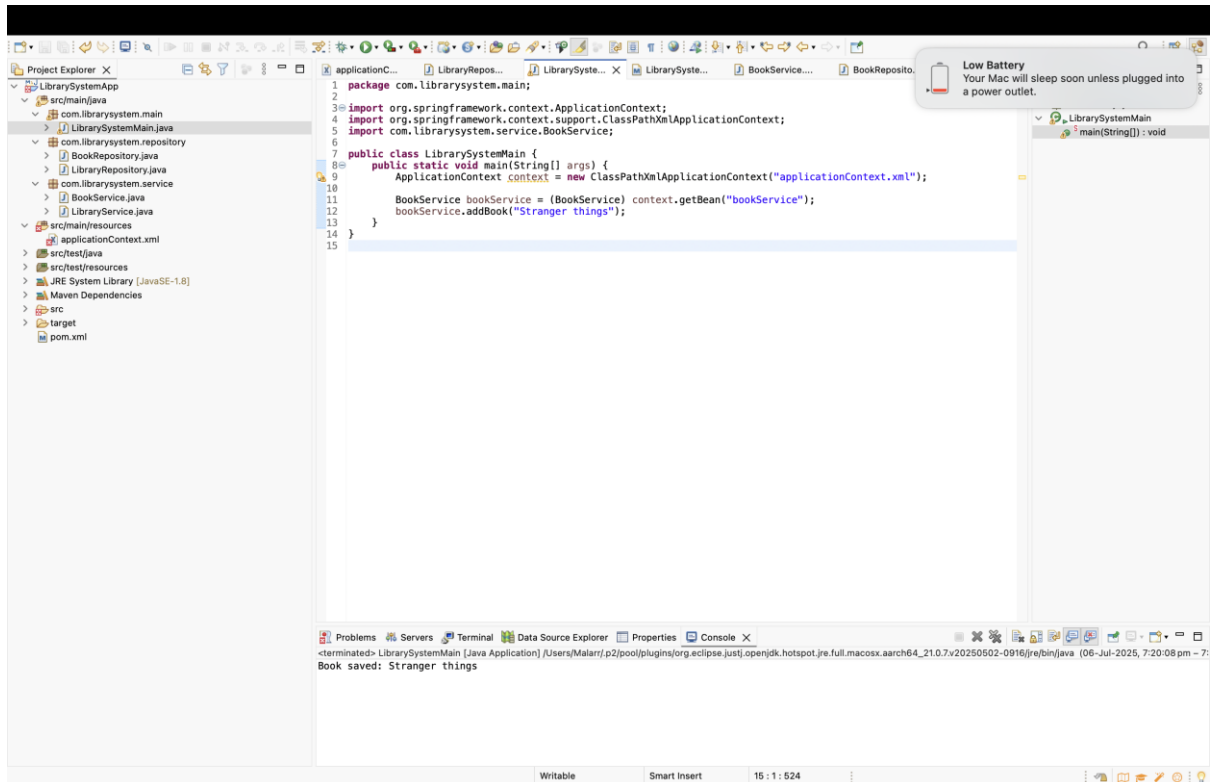

FILE NAME: Spring Core Maven

## EXERCISE –1: Configuring a Basic Spring Application

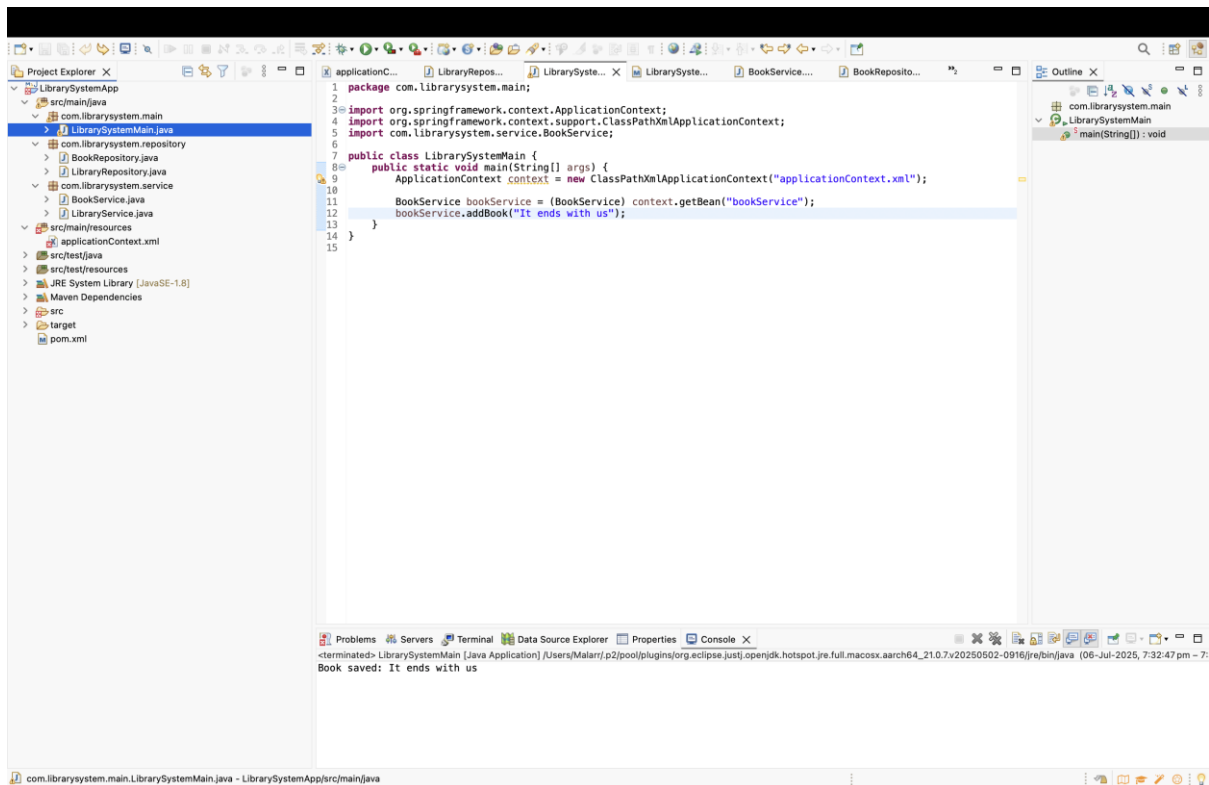

- **Spring Framework:** A Java framework that supports loose coupling using Dependency Injection and aspect-oriented programming.
- **Bean:** An object managed by the Spring IoC container.
- **applicationContext.xml:** A configuration file where Spring beans are declared and wired.
- **Maven:** A build automation tool used to manage project dependencies and structure.

## Exercise 2: Implementing Dependency Injection

- **Dependency Injection (DI):** A design pattern where one object's dependencies are provided by an external source (like Spring).
- **Setter Injection:** Dependencies are passed using setter methods — supported in XML configuration.
- **IoC Container:** Spring's core feature that creates and manages beans and their dependencies.
- **Wiring Beans:** Connecting two beans in Spring so that one can use the other

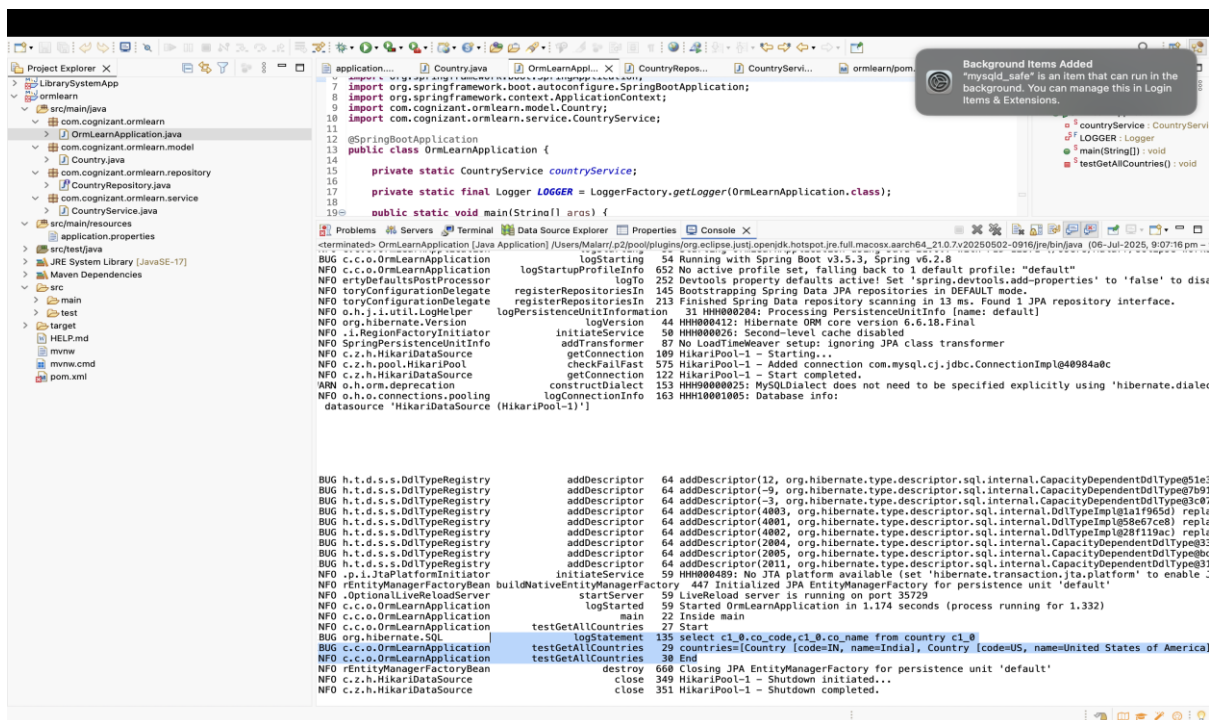

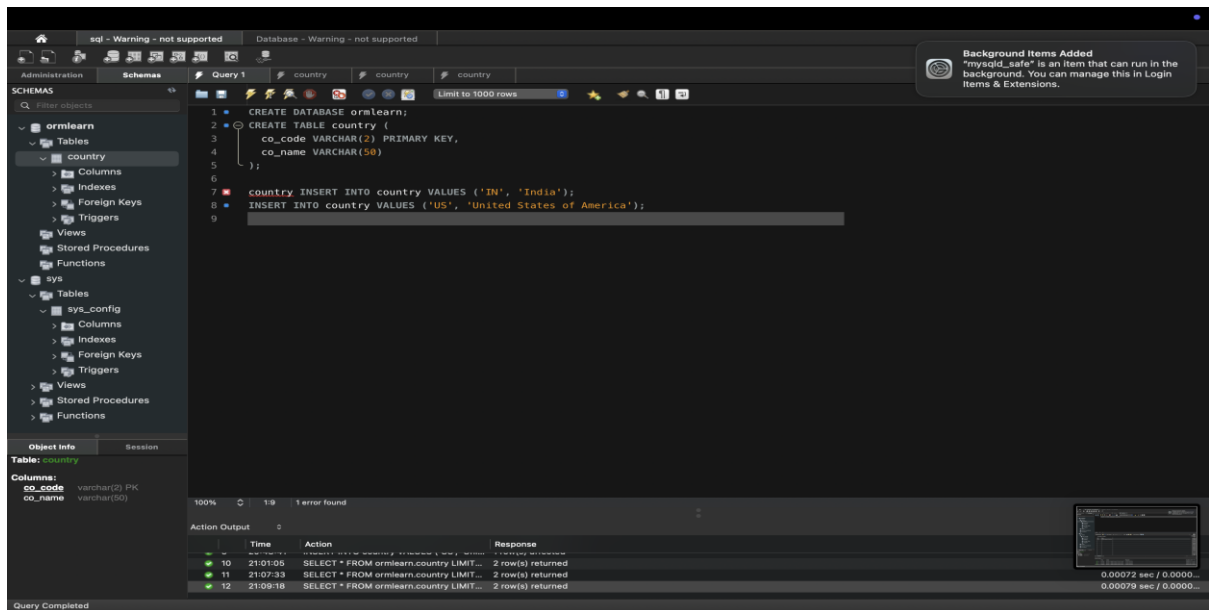

## **Exercise 4: Creating and Configuring a Maven Project**

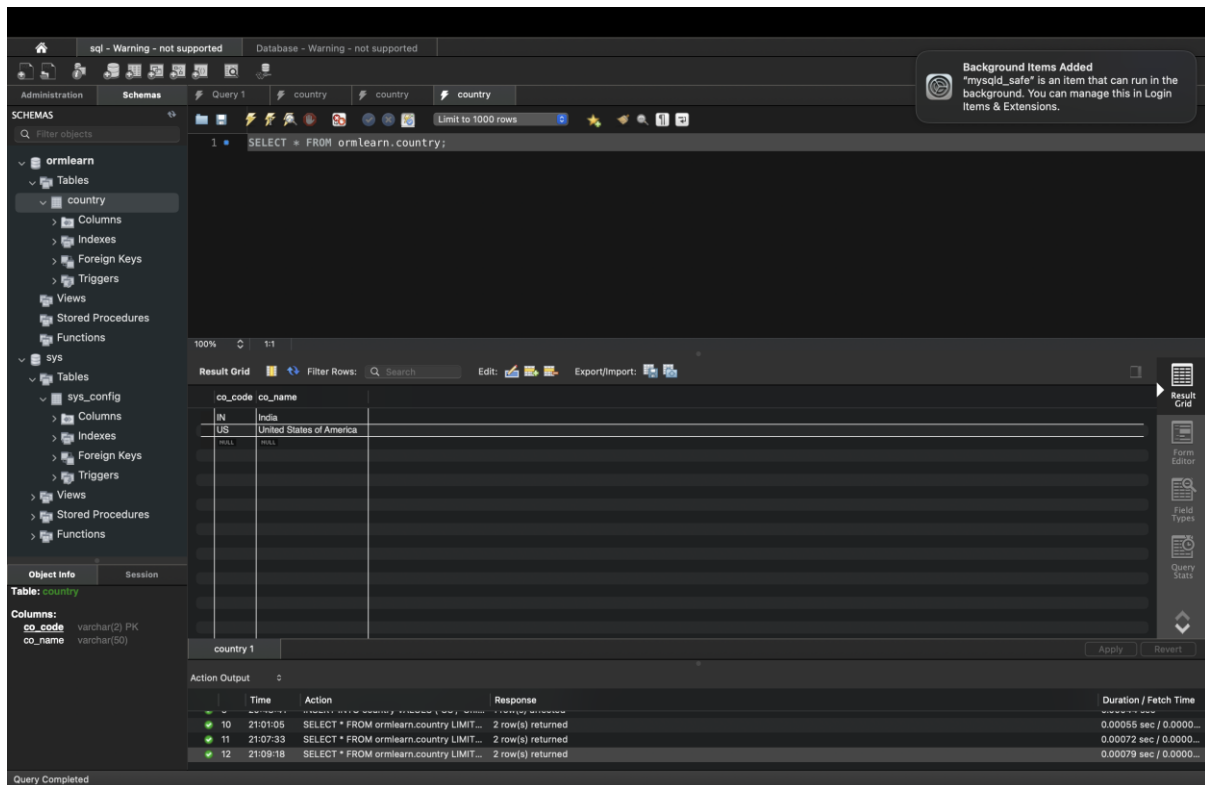

- **Maven Project:** A project managed using Maven, typically following a standard directory structure.
- **pom.xml:** The file where all dependencies, plugins, and project info are defined in a Maven project.
- **Spring Context:** A module that provides the ApplicationContext for managing beans and lifecycle.
- **Maven Compiler Plugin:** A plugin that lets you specify Java version compatibility

FILE NAME : 1. spring-data-jpa-handson

## 1.Spring Data JPA - Quick Example :

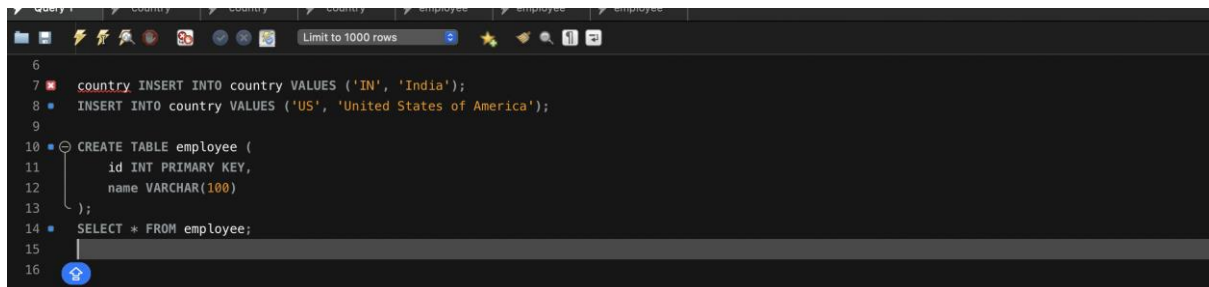

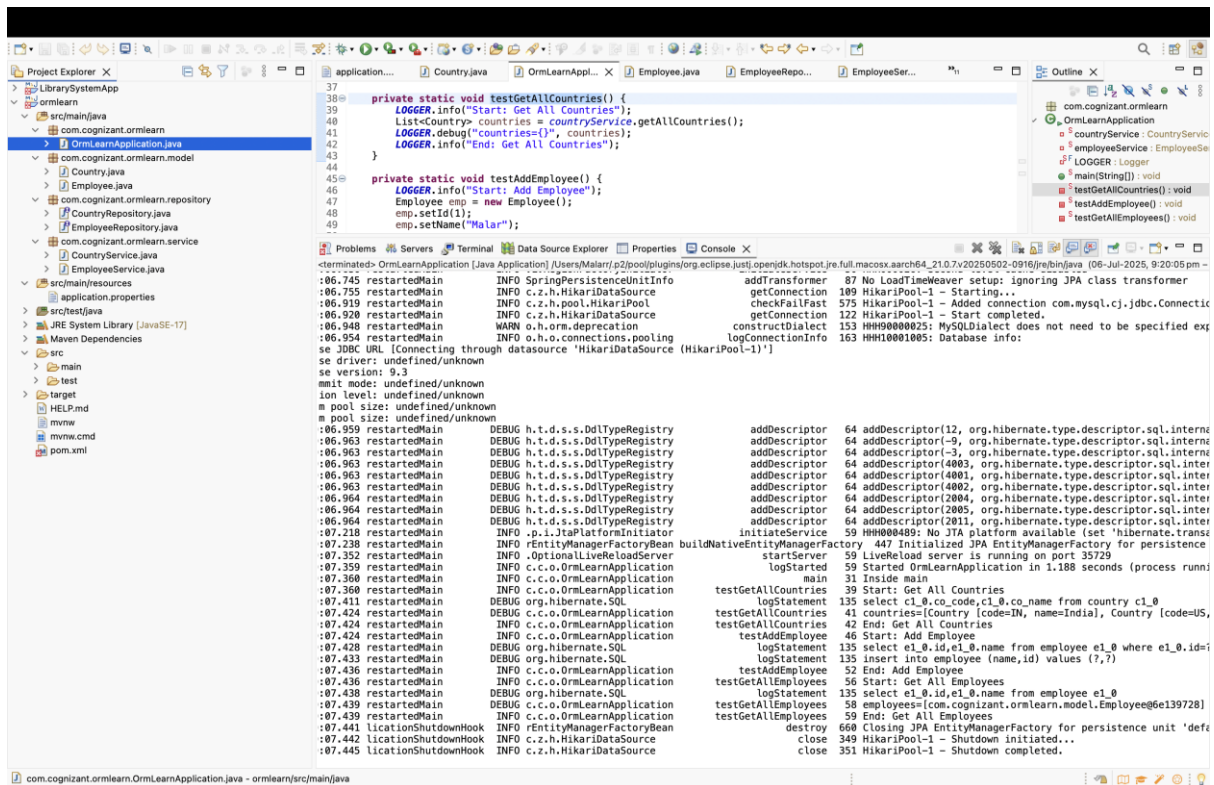

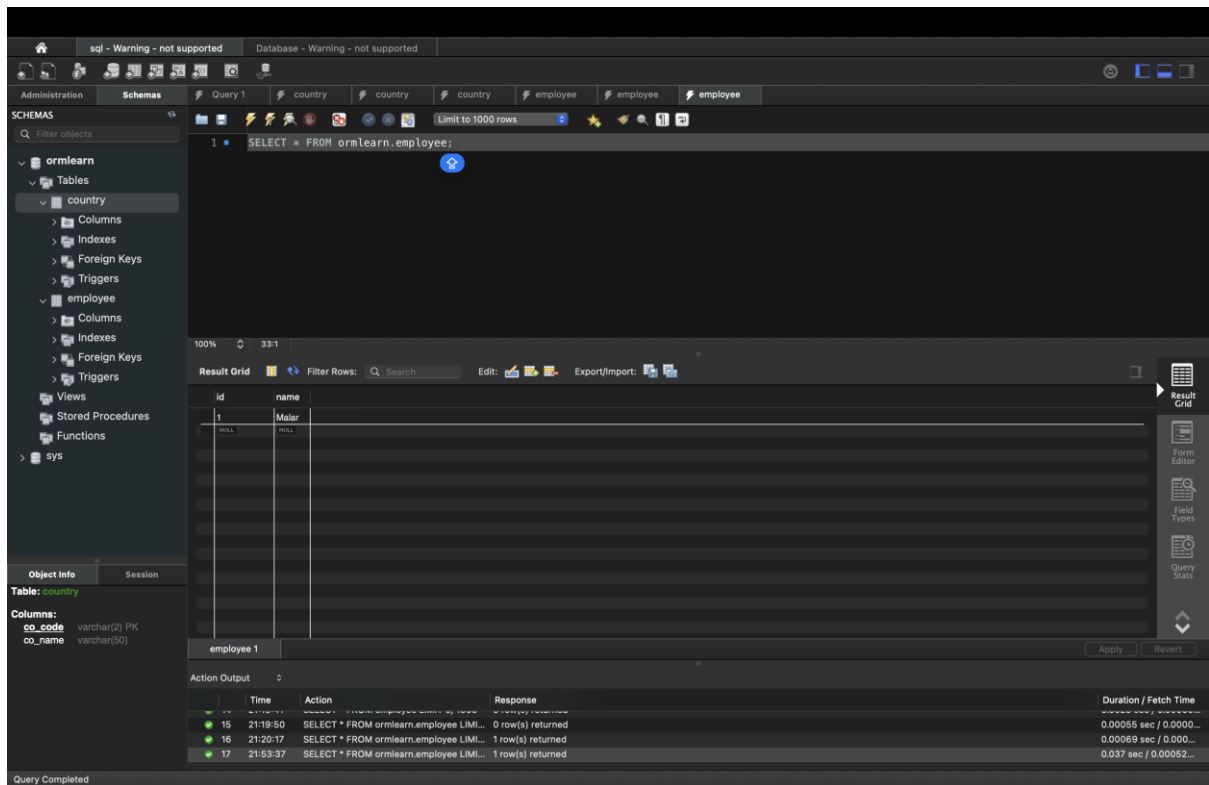

A Spring Boot project that uses **Spring Data JPA** to access and display a list of countries from a MySQL database.

- Uses @Entity, @Id, @Table, @Column annotations
- Fetches country records using findAll() method
- Outputs result to console using SLF4J Logger

## 2. Difference between JPA, Hibernate and Spring Data JPA :

A basic CRUD-enabled service using Spring Boot and Spring Data JPA to add and fetch employee records from a MySQL database.
